+ WOMEN'S HEALTH
Facts, Biases, Delayed Diagnoses, and Opportunities

WOMEN HAVE PREVENTATIVE CARE GAPS

Women are more likely than men to delay healthcare. These gaps could translate to higher rates of women experiencing more severe health issues as time goes on.

50%

In 2020, women were nearly 50% more likely than men to skip a preventative health service or recommended medical test or treatment.

FemTec Health provides convenient, comfortable telehealthcare and use predictive analytics data to deliver on-demand care, education, and resources.

MENTAL HEALTH AFFECTS WOMEN AT WORK

51% of women say worry or stress related to the pandemic has affected their mental health.

According to the CDC, poor mental health and stress can negatively affect employee job performance and productivity. Even after taking other health risks, like smoking and obesity, into account, employees at high risk of depression still had the highest health care costs.

Women are twice as likely as men to be diagnosed with depression.

By addressing mental health issues in the workplace, employers can reduce healthcare costs for their businesses and employees, and increase job performance. FemTec Health addresses stress, anxiety, and other conditions with therapy, counseling, and treatment.

WOMEN NEED TIMELY & ACCURATE DIAGNOSES

Delayed and missed diagnoses are common for women with many health conditions.

Many autoimmune diseases are more common in women. Autoimmune diseases present in women at a rate of 2 to 1. Women make up 90% of all Lupus diagnoses in the U.S.

4.6 **Average number of years it takes a person with an autoimmune disease to get a correct diagnosis**

5 **Average number of doctors a person with an autoimmune disease sees before getting a correct diagnosis**

FemTec Health uses state-of-the-art genomics, predictive intelligence, and digital technologies to create a unique experience for every woman's journey. FemTec's platform brings together all the research and resources to make this progress possible. A unified approach creates a meaningful and effective experience for women at all stages of life.

VAGINAL MICROBIOME DELIVERS KEY INSIGHTS

About 1 in 3 women (ages 14 - 49) in the US will get BV per year.

An imbalanced vaginal microbiome has an increased risk of Bacterial Vaginosis (BV), which can have severe outcomes.

Studies have shown almost half of menopausal women felt their symptoms made their work life more difficult and 1 in 5 altered their work schedule over it. Experiencing hot flashes also increased women's intent to leave the workforce. With women in the menopause age group eligible for senior management roles, their exit can dent C-suite diversity. It also contributes to the gender pay-gap and feeds into a disparity in pensions.

25% of the world's female population will turn menopausal in 2030.

The imbalances associated with these conditions are easy to detect. Vaginal microbiome reports can identify microbial patterns related to menopause and detect BV. FemTec Health's vaginal microbiome test gives women a deeper understanding of their biology, the kind of analysis they don't get at the gynecologist. It helps detect and treat the microbial imbalances causing these conditions and symptoms.
